

TaskDrop

"If you can ask for it, someone can drop it."

A unified reverse-marketplace: a **Poster** publishes an open-ended request with a benchmark price, **Workers** pitch and negotiate quotes, and funds sit in escrow until the work is verified. One Android app for the whole flow, plus a synced web dashboard to view and monitor everything.

Local Intel

Prepared Sep 5, 2026 Surfaces Android app + Web dashboard

Status Planning – not yet built

01 The concept

Existing platforms force people into narrow buckets — food delivery, home repair, digital freelancing — with fixed pricing and no way to post an open-ended need. TaskDrop inverts the model: you post the request, the market comes to you, and price is set by conversation instead of an algorithm.

Dual-mode app

A seamless toggle between **Post a Request** (User mode) and **Find Work** (Worker mode) in one account.

Dynamic quoting

Posters set a benchmark price; workers pitch quotes and negotiate directly, in-app.

Interactive feed

A Reels-style feed where workers showcase real skills and posters flag urgent or unique tasks.

02 Tech stack & how sync works

The core requirement is that mobile and web stay in sync. The cleanest way for a small team is **one backend both clients talk to, with realtime built in** — so a bid placed on the phone appears on the dashboard instantly, and the reverse.

LAYER	CHOICE	WHY
Backend / DB	Supabase — Postgres, Realtime, Auth, Storage, Row-Level Security	One source of truth with realtime push out of the box; no custom socket server to run.
Android app	Flutter (or React Native)	Smooth for a video-heavy reels feed; single codebase can add iOS later.
Web dashboard	Next.js + React	Fast read-only dashboard against the same Supabase project.
Payments / Escrow	Razorpay Route (or Stripe Connect)	Escrow-style holds, split payouts, and commission are first-class.
Media feed	Supabase Storage / Cloudflare Stream	CDN-backed photo & video delivery.
Notifications	Firebase Cloud Messaging	Push for new bids, messages, and status changes.
Maps / radius	Google Maps SDK + PostGIS	Distance filtering and local-intel geo features.
Masked calling	Exotel / Twilio number masking	Poster ↔ worker calls without exposing real numbers.

THE SYNC MODEL IN ONE LINE

Both apps read and write the same Postgres tables through Supabase; Realtime pushes every change — new bid, new message, status transition — to whoever is watching. Sync is a property of the architecture, not a feature you build twice.

03 Who uses it

Poster / User mode

Posts requests, reviews bids, locks a worker, pays into escrow, confirms completion.

Worker / Worker mode

Browses the feed and tasks, sends quotes, does the work, uploads proof, gets paid.

Same account, both modes

One profile toggles between posting and working — the deck's core "dual-mode" idea.

Admin / ops

Moderation, verification approvals, dispute resolution, payout oversight — mostly on web.

04 The task lifecycle

Every task moves through one main line of states. The exception paths below branch off it — cancellations, the overrun stop, and disputes.

OPEN

01

Request posted

Poster publishes the request; workers send competing quotes, each with an estimated duration.

↓ Poster locks the quote they like poster · lock

LOCKED

02

Deal committed to one worker

Other bids auto-close. Funds move into **escrow** now. A short free-cancel grace window opens.

↓ Worker slides the swipe-to-start bar worker · start ▶

TASK_STARTED

03

Work is underway

In-app **chat** and **masked phone calls** unlock for both sides. A live timer runs against the agreed duration.

↓ Worker uploads proof & marks done worker · work done

WORK_DONE

04

Awaiting confirmation

Proof (photos / video / files) is submitted. **No payment yet.** A 24-hour auto-release timer starts.

↓ Poster taps Work Completed (or 24h elapses) poster · confirm

COMPLETED

05

Escrow released

Funds pay out to the worker minus commission. Both sides leave ratings and reviews.

Exception paths

LOCKED → CANCELLED

Before the worker starts: free within the grace window, otherwise a small flat fee to the worker.

TASK_STARTED → CANCELLED_BY_POSTER

Penalty applies. Poster pays a fee from escrow; the worker is compensated for committed effort.

TASK_STARTED → STOPPED_BY_POSTER

Unlocks only once elapsed time exceeds **2× the agreed duration** — the Uber/Rapido-style "this is taking too long, stop" control. No standard penalty.

WORK_DONE / TASK_STARTED → DISPUTED

Poster reports a late / undone / stalling worker. Hits the worker's rating, review, and standing; admin reviews before any refund is finalized.

05 Deal rules, solved the Uber way

Uber's marketplace already answers the hard money-and-timing questions. Each rule below maps what Uber does onto the TaskDrop equivalent.

1 • Pre-start cancellation

Uber: free window, then flat fee

Uber lets you cancel free for a few minutes, then charges a small flat fee once a driver has committed. → Free to cancel within a **5-minute grace window** after locking, or any time before the worker slides Start; after that, a **small flat fee** (₹20–50) goes to the worker.

2 • Penalty after start

Uber: flat – but rides are uniform

Uber's fee is flat because every ride is similar in value; TaskDrop tasks range from ₹80 to ₹40,000, so a flat fee can't be fair. → Take Uber's **principle** (compensate committed effort) as a **percentage with a floor: 20% of the locked quote, minimum ₹50**, paid to the worker from escrow.

3 • Auto-release after "Work Done"

Uber: fare auto-settles at drop-off

Uber has no "confirm" step — the fare settles automatically and the rider disputes afterward. → Keep the explicit Work Completed tap, but back it with a net: **if the poster neither confirms nor disputes within 24 hours, escrow auto-releases** to the worker.

4 • Who sets the agreed duration

Uber: ETA shown before you book

Uber shows an ETA and you accept it by confirming the ride. → The **worker states an estimated duration in their quote**; the poster sees it before locking, so **locking = accepting it**. That number drives the 2× stop threshold.

Locked-in defaults

Every number lives in an **admin-configurable settings table**, not hardcoded — so you can tune per city or pillar as you learn, exactly like Uber tunes fees by market.

RULE	DEFAULT
Pre-start cancel	Free within 5-min grace or before Start; else flat ₹20–50 to worker
Post-start penalty	20% of locked quote, min ₹50 , paid to worker from escrow
Auto-release	24 h after Work Done → auto-release unless disputed
Overrun stop threshold	2× the agreed duration (worker-set, poster-accepted)
Commission	8–10% from worker payout + 3% checkout fee from poster

06 Feature set

Accounts & trust

- Phone-OTP + email sign-in, profile with skills & tags
- **Verification & "Verified Pro" badge** (ID + skill)
- Two-way ratings & reviews

Posting & discovery

- Post across 3 pillars with media, benchmark price, deadline, location
- **Reels-style feed** for skill showcases & urgent tasks
- Smart filters & **radius matching**; saved searches

Quoting & negotiation

- Worker quotes with **free-quote quota** (5/mo, then credits/subscription)
- Counter-offers and in-app negotiation
- Lock-to-commit → escrow

Transactions

- **Escrow hold on lock**, milestone-aware, verified release
- Commission split + penalties ledger
- Wallet, payouts, invoices

Communication

- Per-task chat: text, media, voice notes, **live video** for ground intel
- **Masked phone calls** (numbers hidden)
- Push notifications

Monetization & safety

- **Featured tasks & promoted showcase posts**
- Reporting, disputes, admin moderation
- Full audit trail on money & calls

07 Android app — screen inventory

The full product lives here: posting, bidding, negotiating, chat, payments, and the feed.

ONBOARDING & AUTH

01 Splash

- 02 **Welcome** — value-prop carousel
- 03 **Sign up** — phone OTP / email
- 04 **Login**
- 05 **Profile setup** — skills, location, mode
- 06 **Permissions** — location, camera, push

HOME & FEED

- 01 **Home feed** — reels-style core
- 02 **Post detail** + CTA
- 03 **Search & filters**
- 04 **Map view** — nearby tasks

WALLET & MONEY

- 01 **Wallet / balance**
- 02 **Escrow status**
- 03 **Payout / withdraw**
- 04 **Transactions & invoices**
- 05 **Buy quote credits** / subscription

POSTER • USER MODE

- 07 **Post a Request** — pillar picker
- 08 **Post details** — media, price, deadline, location
- 09 **My Requests** — open / active / done
- 10 **Request detail** + incoming bids
- 11 **Bid review & compare**
- 12 **Negotiation** / counter-offer
- 13 **Lock quote** → escrow payment
- 14 **Active task** — live timer + Stop (2× gated)
- 15 **Work Completed** confirm
- 16 **Report worker** / dispute

WORKER • WORKER MODE

- 17 Available Tasks — filtered
- 18 Task detail
- 19 Send a Quote — duration + quota
- 20 My Bids — pending / accepted
- 21 Swipe-to-start control
- 22 Active job + milestone tracker
- 23 Upload proof & Mark Work Done
- 24 Earnings & payout

SHARED TASK FLOW

- 01 Chat — text / media / voice / live video
- 02 Masked call
- 03 Milestone tracker
- 04 Ratings & review

GROWTH

- 01 Feature / promote a task
- 02 Boost showcase post
- 03 Referral / invite

PROFILE & SETTINGS

- 01 Public profile
- 02 Edit profile & portfolio
- 03 Get Verified Pro
- 04 Notifications center
- 05 Settings — mode, privacy, payments
- 06 Help / support

08 Web dashboard — pages

A synced window into the same data: monitor and analyze. Mostly read-only, with a few light actions (reply to chat, accept/decline a bid, download invoices). Heavy actions — media posting, live video, payments — stay on mobile.

CORE

- 01 Login — same account
- 01 Dashboard overview — KPIs
- 01 My Requests — table + drill-in

- 01 **Request + bids** — compare side-by-side
- 01 **My Bids / Jobs** (worker side)
- 01 **Active jobs** + milestone status
- 01 **Messages** — read & reply

MONEY & ANALYTICS

- 01 **Wallet & earnings** — charts
- 01 **Transactions & invoices** — downloadable
- 01 **Analytics** — completion, acceptance, response time
- 01 **Profile & portfolio**
- 01 **Verification status**
- 01 **Notifications & settings**

ADMIN CONSOLE

- 01 **Users & verification approvals**
- 01 **Content moderation & reports**
- 01 **Dispute resolution queue**
- 01 **Payouts & commission oversight**
- 01 **Platform analytics** — GMV, MAU, revenue by stream

09 Data model

All entities live in the shared Postgres DB, so both surfaces sync automatically. Highlighted entities are the ones the refined lifecycle and deal rules add.

■ Base entity ■ Added by lifecycle & rules

Key fields on tasks

GROUP	FIELDS
Status	OPEN · LOCKED · TASK_STARTED · WORK_DONE · COMPLETED · CANCELLED_BY_POSTER · STOPPED_BY_POSTER · DISPUTED
Timestamps	locked_at · started_at · work_done_at · completed_at
Timers	agreed_duration · overrun_deadline (started_at + 2×) · auto_release_at (work_done_at + 24h)

10 Build phases

1

MVP — mobile **Flutter + Supabase**

Auth, post request, feed, bids + negotiation, lock → escrow, swipe-to-start, chat, proof + confirm. One city, one or two pillars.

2

Web dashboard **Next.js**

Read-only dashboard, analytics, and messages — synced to the same backend.

3

Trust & money **Razorpay + admin**

Verification/badges, ratings, wallet/payouts, penalties, disputes, admin console.

4

Growth & monetization

Featured tasks, promoted posts, quote credits/subscription, referrals.

5

Scale

More pillars, regional expansion city by city, iOS build.

11 Open decisions

Two calls left before Phase 1 kicks off. Everything else above is decided.

Mobile framework

Flutter — recommended; smooth reels feed, easy iOS path.

React Native — shares a language with the Next.js web build.

Native Kotlin — best performance, no code sharing.

Payments provider

Razorpay Route — recommended; India-first, native escrow & splits.

Stripe Connect — global, limited India domestic support.

Decide in Phase 3 — keep provider-agnostic for now.
